What is PhysioCore AI

PhysioCore AI is a personal movement coach that lives on your phone or laptop. Using only the camera you already own, it watches how you move during exercise and gives you the same kind of feedback a thoughtful physiotherapist would — gentle corrections on your form, a count of how many repetitions you completed cleanly, and a clear plan for what to try next time. There are no wearable sensors to charge, no straps to fasten, and no clinic appointments to schedule. You simply prop up your device, press start, and move.

Behind the friendly interface is a careful blend of science and care. PhysioCore AI combines real-time motion tracking with evidence-based guidance from physiotherapy, sports medicine, and nutrition research. Whether you are rebuilding strength after an injury, easing into a yoga routine, or training in the gym, the app meets you where you are, learns what works for your body, and adapts each session so you keep improving without overdoing it.

In one sentence: PhysioCore AI helps you move better, safely, with feedback you can actually understand — and a plan that grows with you.

What's inside the app

PhysioCore AI brings together a few quietly powerful technologies so you don't have to think about them. Here is what's working behind the scenes.

Capability	What it gives you
Camera-based motion tracking	Built on MediaPipe by Google. Your phone or laptop camera reads twenty-four body landmarks in real time. No wristbands, chest straps, or wearables needed.
Personal AI coach	Powered by Anthropic's Claude AI. Each session ends with feedback written for you, in plain language.
Clinical-grade data export	Sessions can be exported in FHIR R4 format — the international standard for sharing health information with clinics and electronic medical records.
Clinician tools	For physiotherapists: automatic SOAP notes and U.S. CPT billing codes (97110, 97530, 97150) generated from each session.
Evidence-based nutrition	Daily energy targets plus a supplements guide where every recommendation carries a Grade A, B, C, or D from the research literature.
Secure data residency	All your data lives in encrypted Supabase databases hosted in Singapore.

GETTING STARTED

How to set up

Setup takes about five minutes. You only do it once, and you can change any answer later from the Settings page. Visit the app at app-dteam1-mmcv.vercel.app on any modern browser to begin. Here is what each step looks like.

Step 1 — Create your profile

Tell us your name, age, height, and weight. These are used to calculate safe starting loads and your daily energy needs. You can use either metric or imperial units.

Step 2 — Share your goals

Choose one or more focuses: rebuild strength, manage pain, improve mobility, lose weight, build muscle, or simply feel more confident moving. Your goals shape every recommendation the app makes.

Step 3 — Note any conditions

Let the app know about injuries, surgeries, or conditions such as arthritis, low back pain, or knee replacement. PhysioCore AI uses this list to avoid exercises that may not be safe for you and to suggest gentler alternatives.

Step 4 — Set your experience level

Beginner, returning to movement, or experienced. The app picks a starting program that matches — and progresses you week by week as your form and endurance improve.

Step 5 — Allow camera access

When you reach your first session, your browser will ask permission to use the camera. PhysioCore AI uses the video only to read your body position. Nothing is recorded, stored, or sent anywhere — see the Privacy section on page 7.

IN THE SESSION

How to use the session camera

A good session begins with a good setup. PhysioCore AI uses Google's MediaPipe engine to read your body posture in real time, directly through your phone or laptop camera — no wearables required. Spend twenty seconds preparing your space and the rest of the workout will feel natural.

Distance from the camera

Stand far enough away that the camera can see your whole body — from the top of your head to your feet — when you reach overhead or lunge forward. For most people this is between six and ten feet (about two to three metres) from the device. The app will tell you on screen if you drift too close.

Lighting

Aim for a room you would feel comfortable reading in. Soft, even light works best. Try to avoid having a bright window directly behind you, since this can make your body appear as a silhouette. If the room is dim, the app will show a gentle low-light warning so you can flip on another lamp.

Camera angle and surface

Place your device on a stable surface at roughly hip height for standing exercises, or chest height if you will be on the floor. A bookshelf, kitchen counter, or sturdy tripod all work. Aim the camera so it captures a wedge of floor in front of you — this helps the app understand depth.

Choosing an exercise mode

From the session screen you can pick from three modes: Gym (squats, lunges, push-ups, and similar strength exercises), Yoga (held poses with Sanskrit names and breath cues), and Pilates (slower, controlled movements). Each mode uses slightly different rules for what counts as a clean repetition.

Pro tip: Wear clothes that contrast with your wall. Bright leggings against a white wall, or a dark shirt against a pale carpet, gives the camera the easiest time tracking your joints.

AFTER THE WORKOUT

Understanding your report

At the end of every session, PhysioCore AI prepares a short report written by Anthropic's Claude AI — the same kind of thoughtful coach you'd want in the room with you. Each number is meant to be a helpful signal, not a grade, and is most useful when you watch it over time.

Score	What it means	What a healthy range looks like
Form Score	A 0 to 100 summary of how closely your joint angles matched the ideal pattern for the exercise.	70+ is solid technique. 85+ is excellent and a sign you are ready for a slightly harder version.
Reps Counted	The number of repetitions you completed cleanly. Partial or rushed reps are not counted.	Match or beat your last session. Quality always comes before quantity.
Hold Time	For yoga, pilates, and the bottom of squats, the seconds you held the correct position.	Five seconds at the bottom is the goal for strength; longer for mobility and balance work.
Symmetry	How evenly your left and right sides moved through the exercise.	Within 10% side to side is normal. Larger gaps may flag a weaker side worth attention.
Confidence	How clearly the camera could see you. Low confidence usually means lighting or distance.	Above 75% is reliable. Below that, your other scores may be a little noisy.

The rep-by-rep breakdown

Below the scores you will find a row for every repetition. A green dot means the rep met the form threshold; a yellow dot means it was close but missed on depth or speed; a grey dot was discarded as noise. Tap any row to see which joint angle drifted out of range.

Your next session prescription

Every report ends with one or two specific suggestions for next time — for example, slowing the lowering phase of a squat by one second, or adding a five-second hold at the bottom. These are written by the AI coach based on the patterns it noticed in your session.

Sharing with your physiotherapist or doctor

Every session report can be exported as a PDF, with an attached **FHIR R4** Bundle — the international standard used by hospitals and electronic medical records. If your clinician is a physiotherapist, they will also see automatic **SOAP notes** (Subjective, Objective, Assessment, Plan) and the relevant U.S. **CPT billing codes** — 97110 (therapeutic exercise), 97530 (therapeutic activities), and 97150 (group therapy) — ready to drop into their notes.

FUEL

Nutrition and supplements guide

Movement is only half of feeling well. The Nutrition page in PhysioCore AI translates your profile into simple, daily targets you can actually follow — and explains the reasoning behind each one.

Your daily energy target

We calculate your Total Daily Energy Expenditure using a well-established formula (Mifflin–St Jeor) and your activity level. The result is a calorie range, not a strict number, because real days vary. If your goal is weight loss the range is slightly below maintenance; if you are building muscle, slightly above. You can always adjust manually.

Protein, carbohydrates, and fats

Protein supports tissue repair after exercise; carbohydrates fuel the work itself; fats keep hormones happy. PhysioCore AI suggests grams per day for each, scaled to your body weight, with a small bump in protein if you are rebuilding strength or recovering from injury.

Supplements with evidence ratings

Every supplement the app suggests carries a clear grade from the research literature — Grade A, B, C, or D. We never recommend something on hype alone, and we tell you the grade up front so you can decide what's worth your money and what isn't.

Grade	What it means	Example
A	Strong evidence across multiple high-quality trials.	Creatine monohydrate, vitamin D when deficient.
B	Good evidence, with some open questions.	Omega-3 for joint comfort, collagen peptides.
C	Mixed or early evidence; may help some people.	Tart cherry for sleep, magnesium for cramps.
D	Weak or conflicting evidence; usually not worth the cost.	Most fat-burner blends, BCAA powders.

Friendly reminder: Supplements are an extra, not a foundation. Food, sleep, and steady movement do most of the heavy lifting. Please check with your doctor before adding anything new if you take prescription medication.

COMMON QUESTIONS

Frequently asked questions

Q. Do I need any special equipment or wearables?

A. No. PhysioCore AI uses your phone or laptop camera only — no wristbands, smartwatches, or chest straps. A tripod or stack of books helps keep the camera steady but is not required.

Q. How do I open the app?

A. Visit app-dteam1-mmvc.vercel.app in any modern browser on your phone, tablet, or laptop. There is nothing to install.

Q. Does PhysioCore AI replace my physiotherapist or doctor?

A. No, and we don't want to. Think of the app as a daily companion between appointments. If you are recovering from a serious injury or surgery, please keep your clinician in the loop — the app can export a FHIR R4 clinical summary, complete with SOAP notes and CPT codes, ready for their records.

Q. Will my camera footage be sent to a server somewhere?

A. No. Pose detection uses Google's MediaPipe technology and runs directly on your device. The video stream never leaves your computer or phone.

Q. How accurate is the form scoring?

A. Very good for most everyday exercises and yoga poses, with about a five-point margin compared to a trained eye. Accuracy improves the better your lighting and camera distance are.

Q. What if I have pain during a session?

A. Stop. Always. The app includes a check-in before each session and will offer gentler options if you report pain above a 7 out of 10. Sharp, new, or worsening pain is your cue to rest and check with a clinician.

Q. How long should a session be?

A. Most users find fifteen to thirty minutes is the sweet spot. The app will suggest a length based on your goals and how often you train.

Q. What if the camera can't see me clearly?

A. You will see a soft on-screen warning — usually about lighting, distance, or being partly out of frame. The session will pause counting until things look right again, so a fuzzy minute will not hurt your score.

Q. Is PhysioCore AI suitable for older adults?

A. Yes. The Pilates and Yoga modes include slow, low-impact options, and the onboarding asks about balance and joint history so the app can choose appropriate exercises. A chair-supported version is available for most movements.

Q. How do I cancel or pause my account?

A. From Settings, choose Account, then Pause or Cancel. Pausing keeps your history and resumes whenever you are ready. Canceling deletes your data within thirty days — more on that on the next page.

PRIVACY

Privacy and your data

Your privacy is not a footnote at PhysioCore AI. It shapes how the app is built.

What stays on your device

All video from your camera is processed on your device, in real time, by Google's MediaPipe engine, and discarded the moment a frame is read. Your session history, profile, and biometric entries are stored locally first and synced — only if you choose to enable sync — through an encrypted connection to your private account.

Where your data lives

When you do enable sync, your records are stored in encrypted Supabase databases hosted in **Singapore**. This means your data is governed by Singapore's PDPA (Personal Data Protection Act) and stays within a single, well-regulated jurisdiction rather than being scattered across multiple continents.

What we never collect

We do not record, save, or transmit your camera footage. We do not sell, rent, or share your personal information with advertisers. We do not build profiles for marketing purposes.

What we do collect, and why

Numbers only: the results of each session (reps, scores, hold times), the answers you give during onboarding, and any biometrics you choose to enter. These are used to generate your reports, calculate your daily targets, and improve the coaching plan made for you.

Your controls

From the Settings page you can export every piece of data the app holds about you in a clean, portable format. You can also delete your account at any time. When you do, your data is removed from our systems within thirty days. If you share results with a clinician, you stay in control of what is exported and to whom.

Questions about your data? Write to privacy@physiocore.ai and a real person will reply within two business days.

Thank you for trusting PhysioCore AI with your movement. We hope each session leaves you a little stronger, a little steadier, and a little more curious about what your body can do next.

— The PhysioCore AI team
